# RestAssured API Automation Project

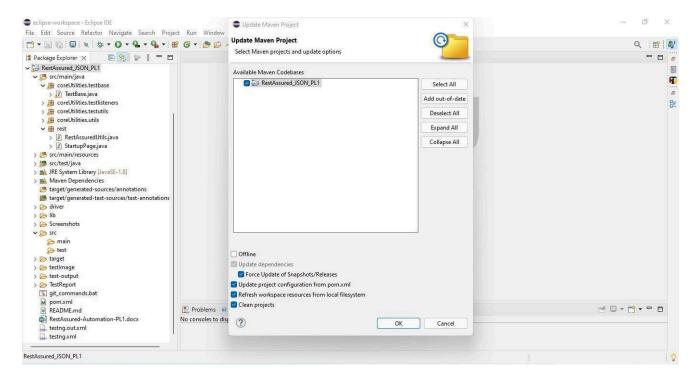

## Pre-requisite:

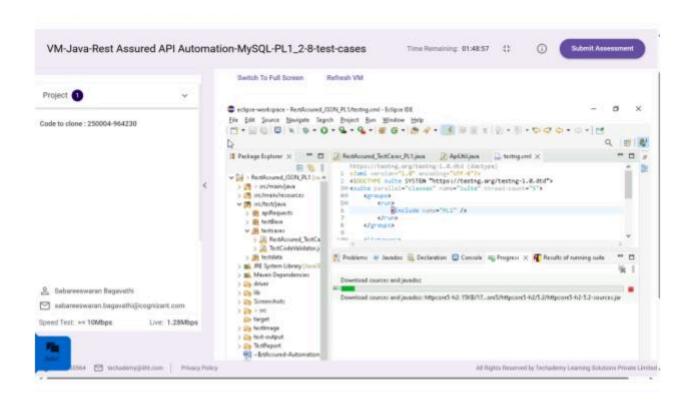

As soon as you import a project in eclipse, update the project using the maven update option as below. This is to resolve issue if any maven dependency not downloaded properly:

1. Right click on project : Go to "Maven" : Select "Update Project"

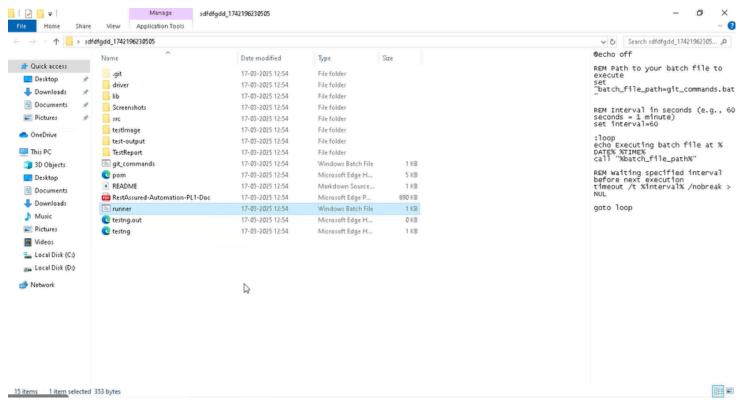

2. In Update Maven Project Box Select "Force Update of Snapshots/Releases" and click OK

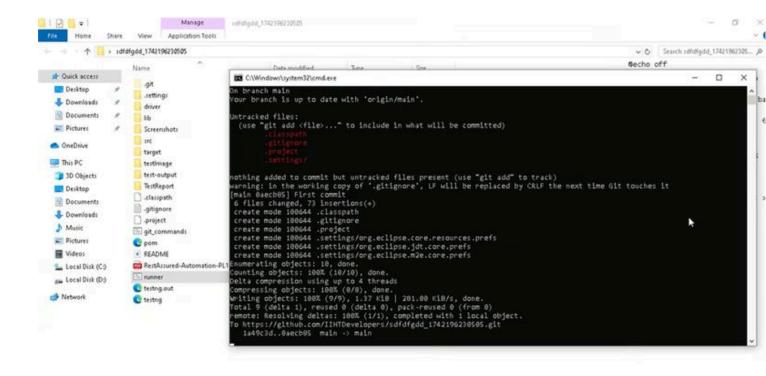

**Note:** Once all the project dependencies are downloaded you may find certain documentation jar files getting downloaded which may continue for a longer time. This is the known behaviour. This will not block your application development activity. You can ignore it and continue working on your application.

\*\* Before starting any implementation. Please execute this "runner" file present in the cloned folder. This will keep pushing the changes at regular intervals.

Witness 1 Steen calculated 252 Status

THE N

# **Template Code Structure:**

- a. Below are the packages and files you will be required to work upon.
- b. Other Files and packages you can ignore.
- c. In other Files and packages do not do any changes. It would affect your evaluation.
- d. You are not required to work in "Test" Folder. Files there are noneditable. Editing those files and trying to save them will throw error and would affect your evaluation.

Package	Class/File	Description
/src/main/java/rest	ApiUtil.java	<ol> <li>All core activities to be performed here.</li> <li>The comments associated with each templated method here describe the</li> </ol>
		expectation. 3. Declare any variable/object you need to share data/status between different methods.
		4. Do not modify the signature of methods declared here.
		5. You can create additional supportive common methods in CommonEvents class.
/src/main/java/rest	AuthUtil.java	<ol> <li>Class already defined to read and return bearer token from</li> </ol>

		config.properties file.
/src/main/java/rest	CustomResponse	We have already created custom response object class. You need to use this and use it as return type from ApiUtil.java class methods.

/src/main/resources/	Config.xlsx	Data present to be used in
		Implementing functions.
/src/main/java/coreUtilities/utils	Common Events. java	<ol> <li>Contains all common activities.</li> <li>Certain templated common methods declared here.</li> <li>You implement them as per your need.</li> <li>You can add any additional method for common activity here</li> </ol>
	Testng.xml	Execution needs to kick started from TestNG xml

## PROBLEM STATEMENT

Need to automate the following activities using RestAssured.

# Key Activities to implement:

Below activities need to be implemented in the ApiUtil.java file present in src/main/java/rest package.

SI	Summary	Action	Expected Result
No. 1	Retrieve list of stocks in Method:  getAllStocks(String endpoint, Object body)	<ol> <li>Create an URL by combining the BASE_URL (already declared) and path parameter (provided as an argument in method). The final URL becomes:         <ul> <li>https://healthapp.yaksha.com/api/PharmacyStock/AllStockDetails.</li> </ul> </li> <li>Include a bearer token for authentication in authorization header.</li> <li>Trigger a GET call to the specified endpoint.</li> <li>Create an object of type CustomResponse and initialize it with values extracted from the Response object:         <ul> <li>Response</li> <li>statusCode (extracted from</li> </ul> </li> </ol>	- Returns an object of type CustomResponse containing statusCode, status, ItemId list, ItemName list, GenericName list and the complete Response object.  - StatusCode should be 200.  - Status should be OK.  - ItemId, ItemName and GenericName should not be null and should not be empty.

			December of the state	1
			Response object)  • Status (extracted from Response object)	
			ItemId list (extracted from	
			Response object)  ItemName list (extracted from	
			Response object)	
			GenericName list (extracted	
			from Response object)	
		5.	Return the CustomResponse	
2	Retrieve main store details in	1.	object from the method.  Create an URL by combining the	- Returns an object of type
-	Method:	1.	BASE_URL (already declared) and	CustomResponse
			path parameter (provided as an	containing statusCode,
	getMainStore(String		argument in method). The final	status, StoreId, Category,
	endpoint, Object body)		URL becomes:	IsActive, and the complete
			https://healthapp.yaksha.com/ap i/PharmacySettings/MainStore	Response object.
				- StatusCode should be 200.
		2.	Include a bearer token for	
			authentication in authorization header.	- Status should be OK.
		3.	Trigger a GET call to the specified	- StoreId, Category and
			endpoint.	IsActive should not be null.
		4.	Create an object of type	
			CustomResponse and initialize it with values extracted from the	
			Response object:	
			• Response	
			<ul> <li>statusCode (extracted from</li> </ul>	
			Response object)	
			<ul> <li>Status (extracted from Response object)</li> </ul>	
			<ul> <li>Storeld object (extracted from</li> </ul>	
			Response object)	
			Category object (extracted from	
			Response object)  • IsActive object (extracted from	
			Response object)	
		5.	Return the CustomResponse	
			object from the method.	
3	Get Requisition List by Date	1.	Create an URL by combining the	- Returns an object of type
	Range in Method:		BASE_URL (already declared) and path parameter (provided as an	CustomResponse containing statusCode,
	getRequisitionByDateRange		argument in method). The final	status, RequistionNo list,
	(String endpoint, Object		URL becomes:	RequisitionStatus list,
	body)		https://healthapp.yaksha.com/ap	RequisitionId list and the
			i/DispensaryRequisition/Dispensa	complete Response object
			ry/1?FromDate=" + fromDate + "&ToDate=" + toDate	- StatusCode should be 200.
				2.aca303ac 3110ala be 200.
		2.	Include a bearer token for	- Status should be OK.
			authentication in authorization	
		<u> </u>	header.	

		<ol> <li>3.</li> <li>4.</li> </ol>	Trigger a GET call to the specified endpoint. Create an object of type CustomResponse and initialize it with values extracted from the Response object:  Response statusCode (extracted from Response object) RequisitionNo list (extracted from Response object) RequisitionStatus list (extracted from Response object) RequisitionId list (extracted from Response object) Status (extracted from Response object) Status (extracted from Response object) Return the CustomResponse object from the method.	<ul> <li>RequisitionNo,         RequisitionStatus and         RequisitionId lists         should not be empty.</li> <li>RequisitionNo,         RequisitionStatus and         RequisitionId lists         should have non-null         values.</li> </ul>
4	Get Patient Consumptions List in Method: getPatientConsumptions(String endpoint, Object body)	<ol> <li>3.</li> <li>4.</li> </ol>	Create an URL by combining the BASE_URL (already declared) and path parameter (provided as an argument in method). The final URL becomes: https://healthapp.yaksha.com/ap i/PatientConsumption/PatientConsumptions  Include a bearer token for authentication in authorization header. Trigger a GET call to the specified endpoint. Create an object of type CustomResponse and initialize it with values extracted from the Response object:  Response statusCode (extracted from Response object) PatientId list (extracted from Response object) HospitalNo list (extracted from Response object) PatientVisitId list (extracted from Response object) Status (extracted from Response object) Status (extracted from Response object) Return the CustomResponse object from the method.	- Returns an object of type CustomResponse containing statusCode, status, PatientId list, HospitalNo list, PatientVisitId list and the complete Response object  - StatusCode should be 200.  - Status should be OK.  - PatientId, HospitalNo and PatientVisitId lists should not be empty.  PatientId, HospitalNo and PatientVisitId lists should have non-null values.

E	Potriovo nationt	1	Create an LIPI by combining the	Poturns an object of type
5	Retrieve patient consumption info in Method:  getPatientConsumptionInfo ByPatientIdAndVisitId(Strin g endpoint, Object body)	2.	Create an URL by combining the BASE_URL (already declared) and path parameter (provided as an argument in method). The final URL becomes: https://healthapp.yaksha.com/api/PatientConsumption/PatientConsumptionInfo?PatientId=114&patientVisitId=53"  Include a bearer token for authentication in authorization header. Trigger a GET call to the specified endpoint. Create an object of type CustomResponse and initialize it with values extracted from the Response object:  Response statusCode (extracted from Response object) PatientName object (extracted from Response object) HospitalNo object (extracted from Response object) Storeld object (extracted from Response object) Status (extracted from Response object)	- Returns an object of type CustomResponse containing statusCode, status, PatientName, HospitalNo, Storeld, and the complete Response object.  - StatusCode should be 200.  - Status should be OK.  - PatientName object, HospitalNo object and Storeld object should not be null.
6	Retrieve Billing Scheme by Scheme ID in Method:  getBillingSchemeByScheme Id(String endpoint, Object body)	2.	Return the CustomResponse object from the method.  Create an URL by combining the BASE_URL (already declared) and path parameter (provided as an argument in method). The final URL becomes: https://healthapp.yaksha.com/ap i/PatientConsumption/Pharmacyl pBillingScheme?schemeId=" + schemeId  Include a bearer token for authentication in authorization header. Trigger a GET call to the specified endpoint. Create an object of type CustomResponse and initialize it with values extracted from the Response • statusCode (extracted from Response object)	- Returns an object of type CustomResponse containing statusCode, status, SchemeCode object, SchemeName object, SchemeId object, and the complete Response object.  - StatusCode should be 200.  - Status should be OK.  - SchemeCode object, SchemeName object and SchemeId object should not be null.

			<ul> <li>SchemeCode object (extracted from Response object)</li> <li>SchemeName object (extracted from Response object)</li> </ul>	
		5.	<ul> <li>Schemeld object (extracted from Response object)</li> <li>Status (extracted from Response object)</li> <li>Return the CustomResponse</li> </ul>	
			object from the method.	
7	Retrieve Billing Summary by Patient ID in Method:  getBillingSummaryByPatientId( String endpoint, Object body)		Create an URL by combining the BASE_URL (already declared) and path parameter (provided as an argument in method). The final URL becomes: https://healthapp.yaksha.com/api/PharmacySales/PatientBillingSummary?patientId=" + patientId	<ul> <li>Returns an object of type CustomResponse containing statusCode, status, PatientId object, TotalDue object and the complete Response object.</li> <li>StatusCode should be 200.</li> </ul>
		3.	Include a bearer token for authentication in authorization header.  Trigger a GET call to the specified endpoint.  Create an object of type CustomResponse and initialize it with values extracted from the Response object:  Response statusCode (extracted from Response object) PatientId object (extracted from Response object) TotalDue object (extracted from Response object) Status (extracted from Response object) Status (extracted from Response object) Return the CustomResponse	<ul> <li>Status should be OK.</li> <li>PatientId object,         TotalDue object should not be null.     </li> </ul>
8	Retrieve Consumptions List of a Patient By ID in Method:  getConsumptionsListOfAPa tientById(String endpoint, Object body)	<ol> <li>1.</li> <li>2.</li> <li>3.</li> </ol>	object from the method.  Create an URL by combining the BASE_URL (already declared) and path parameter (provided as an argument in method). The final URL becomes:  https://healthapp.yaksha.com/api/PatientConsumption/ConsumptionsOfPatient?patientId="+patientId+"&patientVisitId="+patientVisitId"  Include a bearer token for authentication in authorization header.  Trigger a GET call to the specified	- Returns an object of type CustomResponse containing statusCode, status, PatientConsumptionId list, ConsumptionReceiptNo list, TotalAmont list, and the complete Response object.  - StatusCode should be 200.  - Status should be OK.  - PatientConsumptionId list,

endpoint.  4. Create an object of type CustomResponse and initialize it with values extracted from the Response object:  Response statusCode (extracted from Response object) PatientConsumptionId list (extracted from Response object as list) ConsumptionReceiptNo list (extracted from Response object as list) TotalAmount list (extracted from Response object as list) Status (extracted from Response object)	ConsumptionReceiptNo list and TotalAmont list should not be null and should not be empty.
5. Return the CustomResponse object from the method.	

NOTE: "Please do not delete any file in the src folder. But you are free to add any other file".

## **Expectations:**

- 1) Learners should write automation scripts using Java and REST Assured to automate the API testing for all the provided methods (e.g., GET, POST, PUT, DELETE). In other words, the automation script should perform all mentioned API interactions, including validation of responses.
- 2) Learners should not use any pre-built libraries or tools to validate API responses (e.g., JSON schema validation tools). They should manually validate the response content (e.g., status codes, response body, etc.) by writing their own logic for assertion.

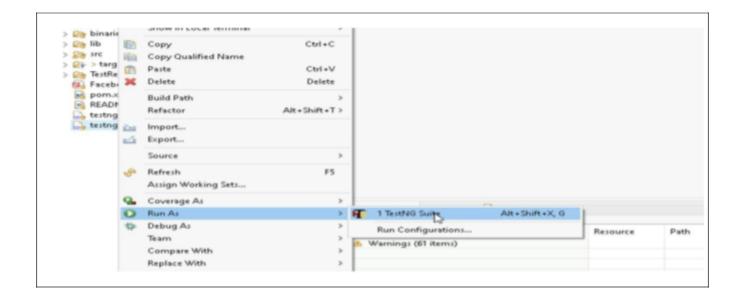

### IMPLEMENTATION/FUNCTIONAL REQUIREMENT

#### 1.1 CODE QUALITY/OPTIMIZATIONS

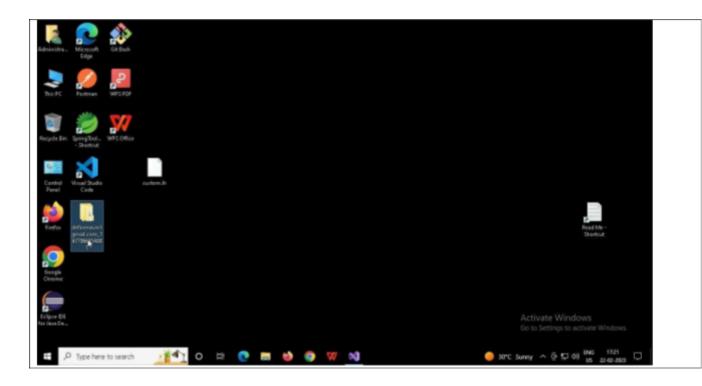

- 1. Associates should have written clean code that is readable.
- 2. Associates need to follow SOLID programming principles.

## **EXECUTION STEPS TO FOLLOW**

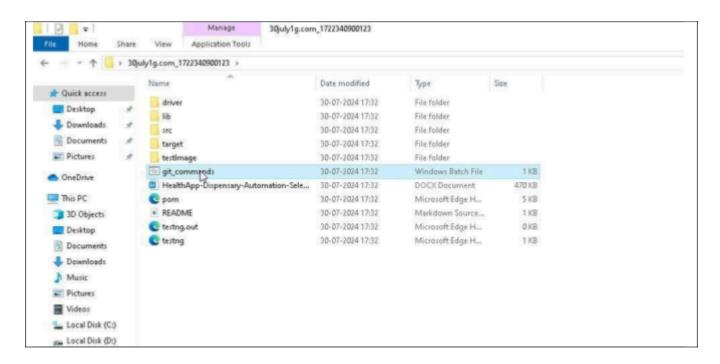

- 1. You are mandatorily required to run test cases for applications before final submission. Without which project evaluation will not happen.
- 2. You can launch test cases any time as follows: Right click on testng.xml and run TestNGSuite

3. Before final submission, you are also required to push your code to GIT. Following are the steps to follow:

In your project folder, you will find a batch file named git\_commands

Double-click the batch file to run it. It will run the commands to push your code to GIT.
